CASE STUDY

From Guessing Game to Peace of Mind

HOME CULTIVATION

Randy Walsh

Home cultivation operation

4 Cure Pucks in operation

5 large outdoor plants annually

6 months of use (since July 2025)

THE PROBLEM

Randy worked long hours and traveled frequently, making consistent manual burping impossible. After 3 years of trial and error with totes, jars, and hygrometers, he was still "flying blind." Timing issues led to hay smells and lost terpenes. He never knew if a batch was successful until the very end, with no ability to fix problems along the way.

THE SOLUTION

Cure Puck eliminated the timing challenges and guesswork. The automated system runs itself, burping on schedule whether Randy is home or traveling. The app provides detailed monitoring of both the tote contents and ambient room conditions, allowing him to catch and fix environmental problems before they impact the cure.

THE RESULTS

- **Consistent results across all batches**
- **Eliminated hay smell—buds smell like "candy"**
- **Perfect terpene retention and flavor profiles**
- **Proper moisture and "sponginess" maintained**
- **Freedom to travel without cure concerns**
- **Significantly reduced manual labor**
- **Quality rating: 9/10 Recommendation: 10/10**
- **Started with 1, bought 3 more after seeing results.**

"It works so damn good that I bought 3 more. It's like an employee you don't have to pay, freeing me up to do other things while the system manages the curing process."

Randy Walsh
Home Cultivator

"The system is close to idiot-proof. You can feel the sponginess of the bud and the taste is what I am expecting. It just works, it makes life so easy."

Randy Walsh
Home Cultivator

OPTIMIZATION

BEFORE

- **3 years of trial and error**
- **Flying blind with manual burping**

NOW

Recommendation:

10/10

Automated monitoring - vacations worry-free
